DETAILED ACTION

Page 2

1. Claims 1 – 10 are pending in the application.

Response to Arguments

2. Applicant's arguments, see p. 3 – 6, filed March 22, 2004, with respect to the rejection(s)of claim(s) 1 – 10 under 35 USC § 103 have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of 35 U.S.C. 102(b) as being anticipated by "Anonymous RPC: Low-Latency Protection in a 64-Bit Address Space" (hereinafter Yarvin).

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States
- 4. Claims 1 10 are rejected under 35 U.S.C. 102(b) as being anticipated by "Anonymous RPC: Low-Latency Protection in a 64-Bit Address Space" (hereinafter Yarvin).
- 5. As to claim 1, Yarvin teaches remote procedure calls in a multiprocessing system [cross-domain remote procedure call; p. 1, Abstract], the multiprocessing system

Art Unit: 2126

including a general purpose processor and a plurality of network processors [for cross-domain procedure calls with few arguments, the dominant cost is saving, clearing, and restoring the registers; Section 3.2.2, p. 5 – 6]; each of the plurality of network processors having a memory [processors with large register sets; Section 3.2.2, p. 5 – 6], comprising the steps of:

- (a) accessing a reserved address [path of control must flow through some intermediary: an entity which is self protected, aware of the RPC binding; Section 3.1, p.4] in the memory of at least one of the plurality of network processors [host architecture supports execute-only page protection; Section 3.1, p. 4], the reserved address comprises a first portion [name] and a second [address] portion [registering an entry point, it gives the RPC manager the name and address of the procedure; Section 3.2.1, p. 5], the reserved address is known to a remote procedure call requestor [caller knows the address of the callee's text, but cannot damage that text or discover where the data might be; Section 3.1, p. 4], the second portion comprises a pointer [address] for an instruction address of a procedure code [registering an entry point, it gives the RPC manager the name and address of the procedure; Section 3.2.1, p. 5], the instruction address is not known to the remote procedure call requestor [to preserve anonymity, the path of control must flow through some intermediary...manage control and data flow without revealing either party's address to each other, cannot give the caller the actual entry point in the callee's code; Section 3.1, p. 4];
- (b) initiating a software action by a first portion [jump instruction] of the reserved address [clients view of the remote call can simply be a function pointer whose target

Page 3

Art Unit: 2126

address is the jump instruction in the anonymity table; p. 6, 3rd paragraph], wherein the software action comprises obtaining the pointer [entry point] in the second portion of the reserved address [contain the entry point as an immediate operand; Section 3.1, p. 4];

- (c) accessing and processing the procedure code at the instruction address utilizing the pointer [use an execute-only jump table, synthesized to contain the entry point as an immediate operand; Section 3.1, p. 4].
- 6. As to claim 2, Yarvin teaches the reserved address comprises one instruction [use an execute-only jump table, synthesized to contain the entry point as an immediate operand; Section 3.1, p. 4].
- 7. As to claim 3, Yarvin teaches each of the network processors include a reserved address [host architecture supports execute-only page protection; Section 3.1, p. 4].
- 8. As to claim 4, Yarvin teaches the location of the reserved address of each network processor is known by the other processors [clients view of the remote call can simply be a function pointer whose target address is the jump instruction in the anonymity table; p. 6, 3rd paragraph].
- 9. As to claim 5, Yarvin teaches the reserved addresses [clients view of the remote call can simply be a function pointer whose target address is the jump instruction in the

Page 4

Art Unit: 2126

anonymity table; p. 6, 3rd paragraph] of each network processor are in the same location of memory [caller knows the address of the callee's text; Section 3.1, p. 4].

10. As to claims 6 – 10, these are system claims that correspond to method claims 1
– 5; note the rejections to claims 1 – 5 above, which also meet these systems claims.

Conclusion

11. Applicant's amendment filed on October 20, 2003 necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.
